

Review and Final Presentation

Name: Daniel Owie

All Work Done to Complete The Contact Us Form

HTML

For the HTML part of the Contact Us form I used different HTML tags and elements. Some of these include: p, form, input, h1, section and button.

I used HTML to create the main part of the website and it was used as the body and structure of it.

CSS

CSS was used to style the website. Using styles like, font-family, color, background-color, margin, padding, text-align, border, height, width and font-weight and more. Without CSS the website would have a bland and unattractive look; so CSS plays a vital role in making the website look good.

Javascript

Javascript is another important part needed for a fully functional website. So using Javascript I added form validation. With that, the website has a more dynamic and functional user interface. Without form validation anything can be entered in an input slot; that makes the website not function well and only Javascript form validation can prevent that.

Javascript

Another important part of Javascript I used was user interactivity. Without user interactivity a user could mistakenly submit a form with a mistake. To prevent that I used user interactivity to ask the user whether they are sure about submitting the form so that they can spot their mistake before submitting the form.
