Week 3 Presentation

React Setup

For the react setup, I had to:

- Download Node.JS.
 - Open terminal on your code editor.
 - Enter `npx create-react-app` (the folder's name).
 - Then your react-app is ready
-

Routing

While routing I had to:

- Import Route, Router, BrowserRouter, Link and React.StrictMode.
 - Have a folder named components, have react files in it and code the parts of the website in it with links.
 - Also have a router in your App.js and import the components into it using the router.
 - And export the App.js file.
-

UI Design

CSS

In the CSS I:

- Used grid to make the form into a row and also the nav bar into two rows with the links.
 - Gave the form and nav bar good colors.
 - Change the font and font size.
-

UI Design

Form Validation

I also used form validation to:

- Ensure users don't submit empty forms.
 - To enhance responsiveness of the website.
-
