

Name: Daniel Owie

Day 1: React Installation and Setup

List of installed software and their uses

Node JS

Node JS is used to build network programs like web servers and tools, as well as real-time applications and APIs.

The version I downloaded was version 21.0.0 which is the latest version.

React

React is a JavaScript library primarily used to build user interfaces (UIs) for web and mobile applications. It can be used to code javascript and HTML into one file and is more convenient to use if you want less files to be used.

The version I downloaded is version 19.1.0 which is also the latest version.

Step by step instructions for setting up the react environment.

Node JS

To download Node JS here are the steps:

- Go to the official Node.js website.
- Download the Windows installer (either 32-bit or 64-bit, depending on your system). The LTS (Long Term Support) version is recommended for most users.
- Locate the downloaded .msi file and double-click to run it.
- Follow the steps you are told to do in the setup wizard.

- Accept the license agreement.
- Use the default installation settings unless you have specific needs.
- In your VS Code, open the command prompt or terminal.
- Type `node -v` and press Enter.
- You should see the installed Node.js version displayed.
- After following these steps your Node JS should be ready to be used.

React

These are the steps to download react on your code editor.

- Open your code editor (I preferably use VS Code for easier and more functional use).
- Then navigate to Terminal and then click “New Terminal”.
- You should see the Terminal appear.
- Then go to the button on the top right of the Terminal that looks like an arrow pointing down.
- Click it and click “command prompt”.
- Then enter `npx create-react-app` (and whatever name you want the folder to be called) in the Terminal.
- After that you should see a loading screen in the Terminal.
- After a while you should see a folder.
- Open it and you see the React file setup for you.
- And now you have your react application.

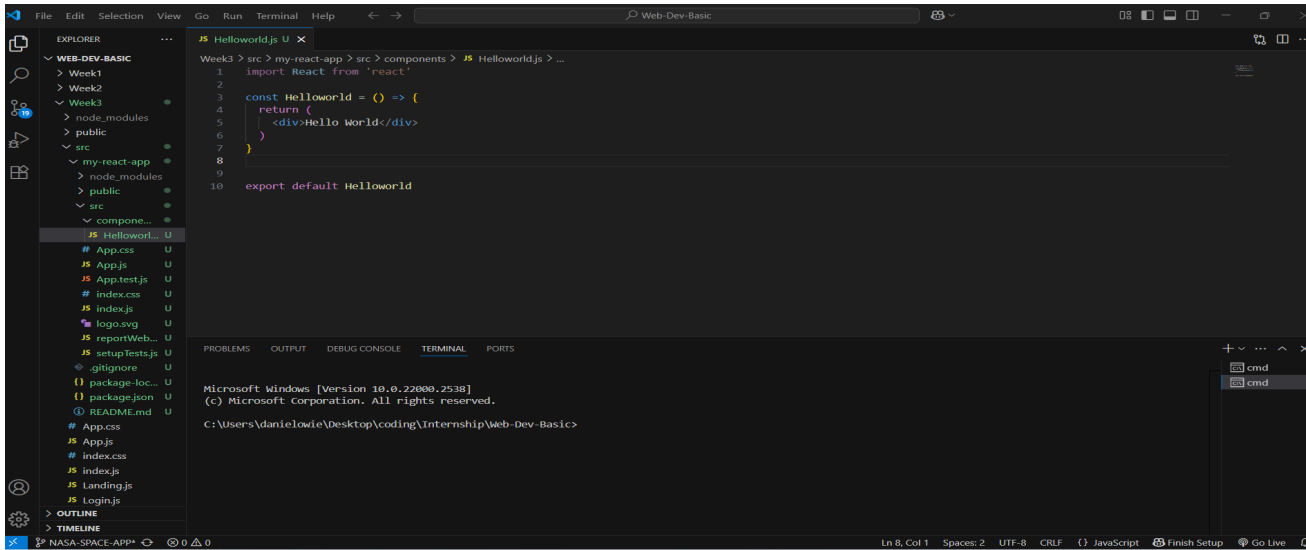

Extensions(ES7 React/Redux/GraphQL/React-Native snippets)

To download this extensions you need to:

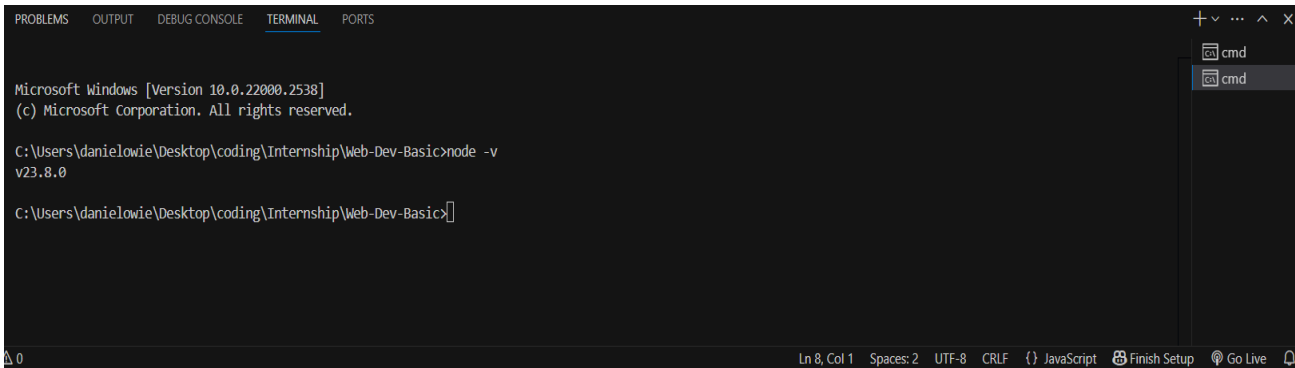

- In your VS Code go to extensions on the left of your screen.
- Then search ES7 React/Redux/GraphQL/React-Native snippets.
- Then click install and it should be ready for use.
