Day 3: Adding Routes for Login and Signup

Routing Setup

Router Download

To download the router you have to follow these steps.

- First open your code editor e.g(VS Code, Sublime Text)
- Then open terminal
- Then in your newly opened Terminal enter “npm install react-router-dom.”

Router Implementation

To be able to use the react router you must import. Then in the component you are importing from you must import { Link } from “react-router-dom”. Finally in App you must import { Routes, Route } from “react-router-dom”

While implementing router you must use the following tags: Routes, Route, Link, React.StrictMode and BrowserRouter.

To start routing you must first have components. These components hold the output of your code. So you create a folder named components and have react files in it for each part of your code. For example if you were creating a website you would have a component named Nav-bar.js for the nav-bar, Main.js for the main part and Footer.js for the footer. In these you would have a function named the name of the file and inside it, you would return “li” tag with a link that has a path of whatever file you are routing. After that you would have a Routes tag and inside it you would have a Route tag.

Then you have to import your components to the App.js file. Next in the App.js file you would have a function named App and in it you would have a routes tag and in it there should be as many route tags as the components with paths of the name of each component and elements of the components name in tags.

Screenshots of the Routing

Code Snippet

```
import React from 'react'
import ReactDOM from 'react-dom/client'
import Login from './components/Login'
import SignUp from './components/SignUp'
import { BrowserRouter } from 'react-router-dom'

function App() {
  return (
    <React.StrictMode>
      <BrowserRouter>
        <Login/>
        <SignUp/>
      </BrowserRouter>
    </React.StrictMode>
  )
}

export default App
```
