

Name: Daniel Owie

Day 4: Design and implement user interfaces for the SignUp and Login pages.

Explanation of Design Choices

Grid

Using grid, I was able to get the links in the nav bar into two rows. With the links being in two rows the nav bar looks better in appearance. I also used grid to get all the elements of the form into a row. Adding grid to the form gives it a better appearance and makes it more understandable and attractive.

Colors

For the color of the nav bar I used a sort of yellowish-orange color which is color coded “rgb(229, 171, 101)”. Then for the form I used a color scheme of black and white to give a good contrast that is very appealing and attractive.

Form Validation

I added form validation to make sure users don't submit an empty form. It works by reading the submitted form; then if an input field of the form is empty then it shows a red text. For name input it tells the user “Name is required”, for email it tells the user “Email is required” and for the password it tells the user “Password is required”. This was important in programming the forms functionality.
